

REPORT ON THE
2018 EXCAVATIONS

AT THE
C-3 JOHN AND ELIZABETH HOWLAND
HOMESITE

By
Craig S. Chartier
Plymouth Archaeological Rediscovery Project

For the
Pilgrim John Howland Society

December 2018

In September of 2017, PJHS members, archaeologists and volunteers, tested the southwest corner of the John and Elizabeth Howland Homestead (**Figure 1**). One of the goals was to investigate piles and possible linear arrangements of stones encountered during brush removal in this area. It appears that, this year, we discovered a previously unknown building in the central area of our excavation. It may be a northern extension of the building associated with the western cellarhole, or it may be a separate building in the northern yard. The artifacts associated with it appear domestic in nature, specifically the bone and ceramics, so it probably was not a barn or outbuilding. Excavation of the units to the east and north have shown that no building remains are present in those areas.

Further excavation around the area we excavated in 2017 was recommended. It appeared that we had found traces of at least one previously unknown building at the site, a building that, due to the orientation of stones we had thus far uncovered, was felt to probably not date to the John and Elizabeth Howland period and which did not appear to have been impacted by Strickland's excavations.

2018 Field Testing

The field crew excavated a total of 10 units of various sizes this year, totaling 40 square feet (**Table 1**).

Table 1. 2018 testing summary

2018 Unit	Size	Square Feet	Location
1	5 x 5'	5	West
2	5 x 5'	5	West
3	5 x 5'	5	South
4	5 x 5'	5	South
5	5 x 5'	5	West
6	2.5' N-S, 5' E-W	2.5	West
7	2.5' N-S by 5' E-W	2.5	West
8	5 x 5'	5	West
9	2.5' N-S, 5' E-W	2.5	West
10	2.5' N-S, 5' E-W	2.5	West
Total		40 Square Feet	

In addition to the new units that were opened this year, several units that had been opened the previous year were reopened (2017-8, 10, 11, 14, and 15) (**Figure 1**).

The 2018 work focused on expanding and more completely exploring the area we worked at in 2017, the southwest portion of the yard between the John and Elizabeth Howland house and the later building cellar hole towards the road. We re-exposed the area that we worked in the previous year to see how extensive the low stone foundations from 2017 were and when they dated to. Our 2018 excavations showed that they appear to represent another building on the property, what appears to be an outbuilding measuring approximately 9 feet east to west by 16 feet north to south (**Figures 2, 3, 4, and 5**). The building is not oriented exactly the same as either the John and Elizabeth house or the later

cellar holes, meaning that it may date to a different time period than either. It could date to the period after John's death when Joseph was living across the street, possibly representing an outbuilding of his farm; that it may date to after his occupation to the period when Benjamin Lothrop owned the property, again representing an outbuilding; or that it dates to earlier than then the Howland occupation, possibly representing an outbuilding associated with the occupation of the site by John Jenney.

Excavation of a portion of foundation wall showed that it appeared to represent a modification to an earlier post-in-ground building (**Figures 6 and 7**). The artifacts recovered from the excavation of the postholes appear few and far between, supporting an interpretation of the features being early and possibly associated with Jenney. The working hypothesis is that this was one of the outbuildings that was built on the site by Jenney and sold to John in February 1638/39 “..a house, barn and out-buildings at Rocky Nook, with its uplands and five acres of adjoining meadow”. The building may have started out as post-in-ground and as the post decayed, they were replaced with a low stone foundation. Further investigation of this building next year will help to test this hypothesis. The other area investigated was the southern area between the two later cellarholes. Here Eldon Gay identified a flat stone platform between the cellarholes that may represent a working surface associated with the building, possibly a floor within a barn, or the base of a chimney (**Figure 8**).

Artifacts

Fieldwork this year resulted in the recovery of a total of 832 pieces of prehistoric and historic material cultural material (**Tables 2 and 3**). Significant artifacts from this year's excavations included a brass mouth harp, which offered us a rare opportunity to hear a sound from the 17th century that John and Elizabeth would have heard and enjoyed; a complete Native arrowhead of a style associated with the Pilgrim Period; an early (1620-1650) tobacco pipe fragment; brick fragments that may have been displaced from the Howland house; and lots of shell fragments that may date to after the Howland occupation (**Figure 9**).

Total	177	36	7	401	95	49	40	9	4	4

The architectural and foodways classes (dominated by brick and shell fragments) again made up the largest portion of this year's assemblage (77.2%). Architectural fragments (brick, mortar, window glass, and hand-wrought nails) were concentrated (in decreasing frequency) in Units 2018-6, 2018-1, and 2018-5 (Table 4).

Shellfish remains were concentrated in Units 2017-11 and 2018-5 and 6. These units were all located at the southern end of the main excavation area and may be connected with the abundance of shellfish remains found in 2017 associated with the later cellarholes. Species represented consisted mostly of soft-shell clam (N=342) and quahog (N=47) with the only other species present being surf clam (N=3).

Bone was scattered across the excavation area with the largest concentration in Unit 2018-6 (Table 4). Four species were represented: Cattle (N=17 fragments), Sheep (N=24 fragments); Swine (N=6 fragments); and Small Duck (N=1 fragment). The majority of the cattle and sheep fragments came from the skull, ribs, and pelvis with fragments of cattle thoracic vertebra, phalanges, and metapodium also present. This differed for the swine fragments, which consisted of mainly limb bones (ulna radius, scapula, tibia) and a few teeth. The bones appear to represent more butchery waste, elements that were consumed but which generally had lower value and were less meaty than elements such as the upper legs, neck, and lower back.

Ceramics were concentrated in Unit 2018-1 (N=13) with lesser concentrations being found in Units 2018-6 (N=6), 2018-9 (N=4) and 2017-14-W (N=4). Other fragments were scattered about in lower concentrations across the excavation area (Table 4). The majority of the fragments were redware, with several fragments from what is believed to be the same redware mug being found in units 2017-15-E, 2018-1, 2018-7, and 2018-9.

Relatively few Tobacco pipe fragments were recovered (N=7) with the majority coming from the 2017 units. Two fragments were found to date to the 18th century, one definitely dated to the 17th, while the remaining fragments were undatable.

Prehistoric artifacts consisted mostly of debitage from making stone tools out of quartz, rhyolite, quartzite, and Saugus Jasper, the last of which must have been traded from the Saugus, Massachusetts

area where it originates. The other raw materials could have been obtained locally from the beaches. Prehistoric material was concentrated in Units 2018-1 (N=32), 2018-9 (N=20), and 2018-6 (N=13). One quartz possible Squibnocket Triangle, dating from the Late Archaic Period (4500-3000 years before present) and one Late Woodland (1000-350 years before present) Levanna point made out of rhyolite were recovered along with four pieces of Late Woodland Native pottery. The pottery and the Levanna point were found in the same unit, making it likely they were deposited at the same time.

Features

The possible foundation was found to consist of larger cobbles with smaller cobbles placed between them possibly as chinking stones. The larger cobbles appear to be concentrated in discrete collections which were hypothesized to represent the locations of a posthole foundation that was subsequently replaced by a cobble one one the posts had rotted. In order to test this theory, one of the concentrations of cobbles as photographed, mapped, and then bisected in order to see what was below them and how the stones related to the soils they rested on and in. This concentration was labeled Feature 2 and the eastern half was excavated (**Figures 6 and 7**). The stones were found to rest on top of a posthole measuring 20 cm in diameter (8”) and extending to 35 cm (10”) below the surface. This was a small posthole, indicating that the building it was associated with was not large but may have been an outbuilding associated with a larger, more substantial house. Artifacts associated with this feature were limited to one quartz flake, a piece of charcoal, a hand-wrought nail, and a fragment each of soft shell clam and quahog shell. The fact that the posthole foundation had been replaced with one constructed of cobbles, indicates that the building continued in use for an extended period of time and was subjected to repair or upgrade over time. This was also the same situation we found in 2016 when were excavated the area of what is believed to be the barn to the east- a post supported building that later received a cobble foundation. The recovery of a limited number of artifacts indicates that the post was dug early on in the occupation of the site and does not represent a later structure erected after the Howland period of occupation.

Interpretation

The 9 x 16' foundation uncovered this year is believed to represent an early outbuilding associated with the Howland farm. The orientation was slightly different from that of the Howland House itself, but this may be a result of the blurring of the actual foundation outline as a result of tumbled foundation stones. The removal of the stones would allow the exposure and tracing of the original postholes, which would provide a clearer picture of the outline of the original building shape.

Recommendations

The 2018 excavation area was covered with plastic at the end of the excavation season and lightly backfilled. It is recommended that the excavation area be re-exposed in 2019 and work continued here in order to investigate the foundation and its associated posthole features.
